Core Scores Comparison

Higher is better (0-100)

rishikeshyogaschool.com

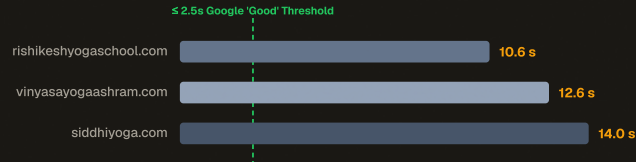

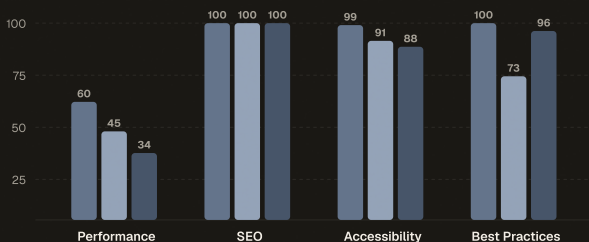

vinyasayogaashram.com

siddhiyoga.com

Mobile Load Speed (LCP)

Lower is better (seconds)

Largest Contentful Paint measures when the primary headline content renders. Google flags anything over 2.5s as failing Core Web Vitals.

AUDIT FINDINGS & RECOMMENDATIONS

Executive Summary: Live Audit Status

✓ Where You're Ahead

Your competitors currently hold the lead across key speed and Core Web Vitals benchmarks. Review the top fixes below to reclaim the advantage.

⚡ Where You're Behind

Your site leads the competitor field on tested metrics. Focus on ongoing caching and schema optimization to maintain your search ranking.

Top 3 Recommended Fixes for yogagarhi.com

Fix #1

Save ~1.2s

Eliminate render-blocking resources

CSS and JavaScript files prevent the browser from rendering headline text and images. Deferring non-critical scripts and inlining critical CSS speeds up first content render.

Fix #2

Save ~650 KB

Serve images in modern WebP / AVIF formats

Legacy JPEG and PNG images consume 50–70% more bandwidth than modern WebP or AVIF formats. Converting images drastically reduces mobile load delays.

Fix #3

Save ~380 KB

Reduce unused JavaScript

Large script bundles and unused third-party plugins are downloaded but never executed. Code-splitting and removing bloated plugins saves mobile CPU time and cellular data.
